

**Ductwork is a hidden system element that circulates warm or cool air throughout your home.**

Working hand in hand with your heating, ventilation, and air conditioning system, together, they are responsible for the comfort of your home.

The older your ductwork, the more potential problems can arise. Unfortunately, ductwork can age like equipment, and every 14-25 years, it should be replaced. When replaced, you benefit from the following:

### Indoor Air Quality

Replacements will help protect your home from allowing dust, bacteria, and pollutants affect what you breathe.

### Energy Savings

Air leaks and drops in air pressure and will make your system work harder than it usually would. A replacement will positively impact your utility bill and the efficiency when the equipment runs.

### More Comfort

New ductwork will improve comfort levels and reduce unwanted changes in humidity and temperature. When new equipment is needed, you will get the most out of a new installation.

### Better R-Value

We now have higher standards for insulation we use for ducting. With the new middle of R8 flex and R8.3 duct wrap, you receive a greater thermal efficiency due to its thicker insulation.

## Signs when a replacement is needed...
